Write a java program to demonstrate operator precedence and associativity

```
OperatorPrecedence.java
import java.util.Scanner;
class OperatorPrecedence
        public static void main(String[] args)
                int x,result;
               System.out.print("Enter a num: ");
               Scanner sc=new Scanner(System.in);
                x=sc.nextInt();
               result=x++ +x++*--x/x++- --x+3>>1|2;
               System.out.println("The operation going is x++ + x++ * --x / x++ --
-x + 3 >> 1 | 2");
        System.out.println("result = "+result);
    }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter a num:
The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2
result = 3
```

```
Test Case - 2
User Output
Enter a num:
The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 \mid 2
result = 2
```

ID: 224G1A05A9 Page No: 1

```
Aim:
```

write a java program that uses if-else control statement and print the result Source Code:

```
Control.java
import java.util.Scanner;
class Control {
        public static void main(String args[]) {
               int x,y,z;
               Scanner sc=new Scanner(System.in);
                System.out.print("Enter first num : ");
               x=sc.nextInt();
               System.out.print("Enter second num : ");
               y=sc.nextInt();
               if(z<20)
               System.out.println("x + y is less than 20");
               System.out.println("x + y is greater than 20");
        }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter first num :
Enter second num :
x + y is less than 20
```

Test Case - 2							
User Output							
Enter first num :							
24							
Enter second num :							
10							
x + y is greater than 20							

Write a program to demonstrate constructor class

Source Code:

```
Student.java
class Student
        int id;
        String name;
       void display()
                System.out.println(id+" "+name);
        public static void main(String args[])
               Student s1=new Student();
               Student s2=new Student();
               s1.display();
               s2.display();
        }
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
0 null
0 null
```

Write Java program on use of Inheritance.

Create a classVehicle

- contains the data members **color** of String type and **speed** and **size** of integer data type.
- write a methodsetVehicleAttributes() to initialize the data members

Create another classCarwhich is derived from the classVehicle

- contains the data membersccandgearsofintegerdata type
- write a methodsetCarAttributes() to initialize the data members
- write a methoddisplayCarAttributes() which will display all the attributes.

Write another class InheritanceDemo with main() it receives five arguments color, speed, size, cc and gears. Source Code:

InheritanceDemo.java

ID: 224G1A05A9 Page No: 15

```
Srinivasa Ramanujan Institute of Technology 2022-2026-CSE-B
```

Execution Results - All test cases have succeeded!

b1.setCarAttributes(args[0],args[1],args[2],args[3],args[4]);

import java.util.Scanner;

int size;

class Car extends Vehicle

int CC; int gears;

{

}

}

public class InheritanceDemo

}

String color; int speed;

color = c;

void displayCarAttributes()

public static void main(String args[])

Car b1 = new Car();

void setVehicleAttributes(String c,String s,String sp)

void setCarAttributes(String c,String s,String sp,String cce,String gear)

speed = Integer.parseInt(s); size = Integer.parseInt(sp);

setVehicleAttributes(c,s,sp); CC = Integer.parseInt(cce);

gears = Integer.parseInt(gear); displayCarAttributes();

System.out.println("Color of Car : "+color); System.out.println("Speed of Car : "+speed); System.out.println("Size of Car : "+size); System.out.println("CC of Car : "+CC);

System.out.println("No of gears of Car : "+gears);

class Vehicle

{

	Test Case - 1

Size of Car : 20	
CC of Car : 1000	

Test Case - 2
User Output
Color of Car : Orange
Speed of Car : 120
Size of Car : 25
CC of Car : 900
No of gears of Car : 5

ID: 224G1A05A9 Page No: 17

write a java program to prevent inheritance using abstract class.

- Create an abstract class Shape
- Create a class Rectangle which extends the class Shape
- \bullet Class Rectangle contains a method $\mbox{\it draw}$ which prints $\mbox{\it drawing}$ $\mbox{\it rectangle}$
- Create another class circle1 which extends Shape
- Class circle1 contains a method draw which prints drawing circle
- Create a main class TestAbstraction1
- · Create object for the class circle1 and called the method draw

Source Code:

```
TestAbstraction1.java
abstract class shape
        abstract void draw();
}
        class Rectangle extends shape
{
        void draw()
                System.out.println("drawing rectangle");
class Circle extends shape
{
        void draw()
                System.out.println("drawing circle");
}
class TestAbstraction1
{
        public static void main(String args[])
{
        shape s = new Circle();
        s.draw();
}
}
```

Aim:

Write a program on method overriding

Source Code:

```
Bike.java
class Vehicle
        void run()
                System.out.println("Bike is good");
}
class Safe extends Vehicle
        void run()
                System.out.println("Bike is running safely");
        }
}
class Bike
        public static void main(String args[])
                Vehicle obj = new Safe();
                obj.run();
        }
}
```

Execution Results - All test cases have succeeded!

Test Case - 1 User Output Bike is running safely

ID: 224G1A05A9 Page No: 22

Aim:

S.No: 16

Write a Java program that implements an interface.

```
Create an interface called <a href="Car">(Car</a> with two abstract methods <a href="String getName">(String getName</a>()) and <a href="interface">int getMaxSpeed</a>()). Also declare one <a href="Method void applyBreak">declare one default method void applyBreak</a>() which has the code snippet <a href="System.out.println("Applying break on " + getName());">System.out.println("Applying break on " + getName());</a>
```

In the same interface include a **static** method <u>Car getFastestCar(Car car1, Car car2)</u>, which returns **car1** if the **maxSpeed** of **car1** is greater than or equal to that of **car2**, else should return **car2**.

Create a class called BMW which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Similarly, create a class called Audi which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Create a public class called MainApp with the main() method.

Take the input from the command line arguments. Create objects for the classes BMW and Audi then print the fastest car.

Note:

Java 8 introduced a new feature called default methods or defender methods, which allow developers to add new methods to the interfaces without breaking the existing implementation of these interface. These default methods can also be overridden in the implementing classes or made abstract in the extending interfaces. If they are not overridden, their implementation will be shared by all the implementing classes or sub interfaces.

Below is the syntax for declaring a default method in an interface :

```
public default void methodName() {
    System.out.println("This is a default method in interface");
}
```

Similarly, **Java 8** also introduced **static** methods inside interfaces, which act as regular static methods in classes. These allow developers group the utility functions along with the interfaces instead of defining them in a separate helper class.

Below is the syntax for declaring a static method in an interface :

```
public static void methodName() {
    System.out.println("This is a static method in interface");
}
```

```
ID: 224G1A05A9 Page No: 24
```

```
q11284/MainApp.java
package q11284;
interface Car {
        abstract String getName();
        abstract int getMaxSpeed();
        public default void applyBreak()
                System.out.println("Applying break on "+getName());
        }
        public static Car getFastestCar(Car car1,Car car2)
                if(car1.getMaxSpeed()>=car2.getMaxSpeed())
                        return car1;
                else
                        return car2;
        }
class BMW implements Car {
        String name;
        int speed;
        public BMW(String n, String s){
                speed=Integer.parseInt(s);
                name=n;
        public String getName(){
                return name;
        public int getMaxSpeed(){
                return speed;
class Audi implements Car {
        String name;
        int speed;
        public Audi(String n, String s){
                speed=Integer.parseInt(s);
                name=n;
        public String getName(){
                return name;
        public int getMaxSpeed(){
                return speed;
}
public class MainApp {
        public static void main(String args[]) {
                BMW bmw=new BMW(args[0],args[1]);
                Audi audi=new Audi(args[2],args[3]);
                Car max=Car.getFastestCar(bmw,audi);
                System.out.println("Fastest car is : "+max.getName());
        }
```

Execution Results - All test cases have succeeded!

Test Case - 1	
User Output	
Fastest car is : BMW	

Test Case - 2		
User Output		
Fastest car is : Maruthi		

ID: 224G1A05A9 Page No: 25

Aim:

Write a Java program to create an exception.

Source Code:

Execution Results - All test cases have succeeded!

Test Case - 1

User Output

Exception caught : divide by zero occurred

ID: 224G1A05A9 Page No: 26

Write a Java code for handling the exception.

Source Code:

```
q222/handleError.java
package q222;
import java.util.Random;

S.No: 24	Exp. Name: program to create a super class called Figure that it returns the area of a rectangle and triangle	Date: 2023-12-07
----------	---	------------------

Aim:

Write a java program to create a super class called Figure that receives the dimensions of two dimensional objects. It also defines a method called area that computes the area of an object. The program derives two subclasses from Figure. The first is Rectangle and second is Triangle. Each of the sub classes override area() so that it returns the area of a rectangle and triangle respectively

Source Code:

AbstractAreas.java

ID: 224G1A05A9 Page No: 39

```
import java.util.*;
abstract class Figure
{
        double dim1;
        double dim2;
        double dim3;
        double dim4;
        Figure(double a,double b)
        {
                dim1=a;
                dim2=b;
                dim3=a;
                dim4=b;
        abstract void area();
class Rectangle extends Figure
{
        Rectangle(double a,double b)
                super(a,b);
        }
        void area()
        {
                double Area=(dim1*dim2);
                System.out.println("Rectangle:");
                System.out.println("Area is "+Area);
class Triangle extends Figure
{
        Triangle(double a,double b)
                super(a,b);
        }
        void area()
        {
                double Area=(dim3*dim4)/2;
                System.out.println("Triangle:");
                System.out.println("Area is "+Area);
}
class AbstractAreas
        public static void main(String args[])
                System.out.println("Enter lenght and breadth of Rectangle :");
                Scanner input = new Scanner(System.in);
                double dim1=input.nextDouble();
                double dim2=input.nextDouble();
                System.out.println("Enter height and side of Triangle :");
                Scanner input1 = new Scanner(System.in);
                double dim3=input1.nextDouble();
                double dim4=input1.nextDouble();
                Rectangle r=new Rectangle(dim1,dim2);
```

```
figuref = r;
         figuref.area();
         figuref=t;
figuref.area();
}
```

Execution Results - All test cases have succeeded!

Test Case - 1
User Output
Enter lenght and breadth of Rectangle :

S.No: 25 Exp. Name: Write a Java program demonstrating the usage of Threads

Date: 2024-01-03

Aim:

Write a Java program that uses three threads to perform the below actions:

- 1. First thread should print "Good morning" for every 1 second for 2 times
- 2. Second thread should print "Hello" for every 1 seconds for 2 times
- 3. Third thread should print "Welcome" for every 3 seconds for 1 times

Write appropriate **constructor** in the <u>Printer</u> class which implements <u>Runnable</u> interface to take three arguments: **message**, **delay** and <u>count</u> of types **String**, **int** and **int** respectively.

Write code in the Printer.run() method to print the message with appropriate delay and for number of times mentioned in count.

Write a class called ThreadDemo with the main() method which instantiates and executes three instances of the above mentioned Printer class as threads to produce the desired output.

[Note: If you want to sleep for 2 seconds you should call [Thread.sleep(2000);] as the [Thread.sleep(...)] method takes milliseconds as argument.]

Note: Please don't change the package name.

Welcome
Good morning
Hello
All the three threads t1, t2 and t3 have completed execution.

Date: 2023-12-14

Aim:

Write a java program to find and replace patterns in a given file. Replace the string "This is test string 20000" with the input string.

Note: Please don't change the package name.

Source Code:

```
q29790/ReplaceFile.java
package q29790;
import java.io.*;
import java.util.*;
class ReplaceFile {
         public static void main(String args[])
                 try
                  {
                         File file = new File("file.txt");
                          BufferedReader reader = new BufferedReader(new
FileReader(file));
                           String line , oldtext=new String();
                            while((line = reader.readLine()) != null)
                                 if(oldtext==null)
                                  oldtext = line + "\r";
                                    oldtext += line + "\r\n";
                              reader.close();
                               System.out.print("Previous string: "+oldtext);
                                // replace a word in a file
                                 //String newtext = oldtext.replaceAll("drink",
"Love");
                                  //To replace a line in a file
                                   String newtext = oldtext.replaceAll("This is test
string 20000", "New string");
                                    System.out.print("New String: "+newtext);
                  }
                   catch (IOException ioe)
                         ioe.printStackTrace();
                    }
 }
```

file.txt

This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

Test Case - 1

User Output

New string

Previous string: This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

New String: New string. The test string is replaced with your input string, check the string you entered is now visible here.

Exp. Name: A java program to demonstrate that the

S.No: 27 catch block for type Exception A catches the exception

of type Exception B and Exception C.

Date: 2023-11-07

Aim:

Use inheritance to create an exception superclass called Exception A and exception subclasses Exception B and Exception C, where Exception B inherits from Exception A and Exception C inherits from Exception B. Write a java program to demonstrate that the catch block for type Exception A catches the exception of type Exception B and Exception C.

Note: Please don't change the package name.
